THE CHILDHOOD OBESITY EPIDEMIC

How will healthy eating and physical activity help my child?

All children benefit from healthy eating and physical activity. A balanced diet and being physically active helps children to:

- Grow
- Learn
- Build strong bones and muscles
- Have energy
- Maintain a healthy weight
- Avoid obesity-related diseases like Type 2 diabetes
- Get plenty of nutrients
- Feel good about themselves

How are physical activity and eating habits formed?

Parents play a big role in shaping children's eating habits. When parents eat a variety of foods that are low in fat and sugar and high in fiber, children learn to like these foods as well. It may take 10 or more tries before a child accepts a new food, so do not give up if your child does not like a new food right away.

Parents have an effect on children's physical activity habits as well. You can set a good example by going for a walk or bike ride after dinner instead of watching TV. Playing ball or jumping rope with your children shows them that being active is fun.

What should my child eat?

Just like adults, children need to eat a wide variety of foods for good health. The USDA's Dietary Guidelines for Americans encourages Americans over 2 years old to eat a variety of nutrient-dense foods.

Recommended items include fruits, vegetables, fat-free or low-fat milk and milk products, lean meats, poultry, fish, beans, eggs, nuts and whole grains. The guidelines also suggest a diet low in saturated fats, trans fats, cholesterol, salt (sodium) and added sugars.

How can I help my child eat better?

- Give your child a healthy snack or two (such as fruits, vegetables, air-popped popcorn or low-fat yogurt), in addition to his or her three daily meals.
- Offer your child a wide variety of healthy foods.
- Keep serving new foods, even if your child resists them at first.
- Cook with less fat – bake, roast or poach instead of frying.
- Limit the amount of added sugar in your child's diet; choose cereals with low sugar and serve water or low-fat milk instead of sugar-sweetened sodas and fruit juices.
- Choose and prepare foods with less salt, keep the salt shaker off the table during meals and limit salt content in snacks.

IT MAY TAKE 10 OR MORE TIMES
BEFORE A CHILD ACCEPTS
A NEW FOOD

Continued

LIVE WELL – WORK WELL

- Involve your child in planning, choosing and preparing meals. Children are more willing to eat the dishes they help fix.
- Have family meals together and serve everyone the same thing.
- Do not be too strict. In small amounts, sweets and fast food can still have a place in a healthy diet.
- Make sure your child eats a nutritious breakfast. It provides him or her with the energy needed to listen and learn in school.

How can I help my child become more physically active?

Like adults, children should be physically active most, if not all, days of the week. Experts suggest at least 60 minutes of moderate physical activity daily for most children. Walking fast, bicycling, jumping rope, dancing fast and playing basketball are all good ways for your child to be active. Other suggestions:

- Involve the whole family in activities such as hiking, dancing, baseball or rollerblading.
- Focus on fun—you can do a lot of walking during trips to the zoo, mall or park.
- Include children in household activities like dog walking, car washing or yard work.
- Limit your children's TV and computer time. Offer them active options, like joining a recreation center or after-school program, or taking lessons in a sport they enjoy.
- Be a good role model. If children see you being physically active and having fun, they will be more likely to stay active. If they see you watching TV every night, they will want to engage in the same behavior.
- Encourage your child to be physically active every day.

How can I help my overweight child?

Children who are overweight are more likely to become overweight adults. They may develop Type 2 diabetes, high blood pressure, heart disease and other illnesses that can follow them into adulthood. Being overweight can also lead to stress, sadness and low self-esteem.

Because children grow at different rates at different times, it is not always easy to tell if a child is overweight. For example, it is normal for boys to have a growth spurt in weight and catch up in height later. Your health care provider can tell you if your child is in a healthy range. If your physician determines that your child is overweight, you can help:

- Do not put your child on a weight-loss diet unless his or her physician indicates that this is a beneficial action to take. Limiting what children eat may interfere with their growth.
- Involve the whole family in building healthy eating and physical activity habits. It benefits everyone and does not single out the overweight child.
- Accept and love your child at any weight. It will boost his or her self-esteem.
- Help your child find ways other than eating to handle stress, setbacks or successes.
- If your child spends time in child care, make sure the facility serves nutritious meals and snacks, and encourages plenty of physical activity.

Talk with your health care provider if you are concerned about your child's eating habits or weight. Remember, you play the biggest role in your child's life. You can help your children learn healthy habits that they can follow for the rest of their lives.
